

1. What is an Axiom ?
2. Name the three general types of Axioms in Book I of Euclid's Elements.
3. What is a point ?
4. When a straight line set up on a straight line makes adjacent angles equal to one another, what type of angles are created ? Also, what is the relationship of the two lines ?
5. Name two types of figures that are not rectilinear ?
6. Proposition 1 (below) is labeled with roman numerals. List the roman numerals and name the section that each represents.
7. Fill in the missing parts of Proposition I below.

Section	Statement	Reference
I	To construct an equilateral triangle on a given finite straight line.	
II	Let _____ be the given finite straight line.	
III	It is required to construct an _____ on the straight line _____.	
IV	Describe the circle _____ with center ____ and radius _____.	[_____]
	Again describe the circle _____ with center ____ and radius _____.	[_____]
	Join the straight lines _____ and _____ from the point ____ at which the circles cut one another to the points _____ and _____.	[_____]
V	Now, since the point _____ is the center of the circle _____, therefore straight line _____ equals straight line _____.	[_____]
	Again, since the point _____ is the center of the circle _____, therefore straight line _____ equals straight line _____.	[_____]
	Therefore each of the straight lines _____ and _____ equals straight line _____. And things which equal the same thing also equal one another, therefore _____ also equals _____.	[_____]
	Therefor the three straight lines _____, _____ and _____ are equal to one another.	
VI	Therefore the triangle _____ is _____, and it has been constructed on the given finite straight line _____. Being what it was required to do.	[_____]
